Milk composition in hoof and mouth disease. F.  
Gabrielyan. *Molokozovskaya* Press, 10, No. 12, 37 (1940).  
Fat and casein content rise (by about 0.5%), total solids  
rise, and the viscosity rises by 25-30%. Surface tension is  
lower than normal (40-50 dynes/cm.). Acidity is some-  
what lower and curdling is retarded. The curd is soft  
and contains much fat. G. M. Kosolapoff

GABRIELYAN, T.  
USSR.

✓ Physical and chemical properties of milk and the technology of Swiss-cheese manufacture at the Kraanosel factory, Z. Dilyan and T. Gabrielyan. *Molochnaya Prom.* 13, No. 4, 37-9(1952); *Dairy Sci. Abstr.* 15, 225-8(1953).—All milk received during a 2-month period at a cheese factory was tested for sp. gr., acidity, casein, and butterfat and the results are tabulated. A time study of the manuf. of Swiss-type cheese at the same factory showed that, as the butterfat content of cheese milk was raised from 3.3-3.4 to 4.1-4.2%, the time taken for renneting, curd treatment in the vat, and whey drainage increased from 2 hrs. 15 min. to 3 hrs. 7 min. and that for pressing from 24 to 31 min. This is stated to be due to the adverse effect of butterfat on the contraction of curd. R. D. H.

Title : A Formula for the Determination of the Total Solids Content of the Milk from Armenian Cows.

Orig Pub : Izv. AN ArmSSR Biol. i s.-kh. n., 1955, Vol 8, No 3, 55-60

Abstract : A formula is proposed for the determination of the total solids content of the milk from Armenian cows:  $S = 1.22 F - 2.78 \left[ \frac{(100d - 100)}{d} \right]$ , where S is the percent of total solids, F is the fat content in gms/100 ml, d is the density of the milk at 20/4°. The coefficients 1.22 and 2.78 are calculated from the average density of milk fat (0.9266 at 20/4°) and of the dry residue of skimmed milk (1.5616)

On the axisymmetric equilibrium of elastic spherical  
shells under the action of evenly-distributed pressure

PERIODICAL: Prikladnaya matematika i mekhanika, v. 25, no. 6,  
1961, 1091 - 1101

TEXT: The problem under consideration is one of those elasticity-  
problems, for which the idealization of actual systems leads to  
considerable error. It is assumed that the actual shell differs  
slightly from the ideal shell (for simplicity) by a single parameter  $f$ . The shell  
plane, denoted as a result of the external pressure  $p$ , the local buck-  
ling  $w$ . The character of the curve  $p = p(w)$  is determined by  $f$  (see  
Fig. 1). The solution of the problem involves determination of the  
so-called minimum buckling load  $p_{0 \min}$  which delimits the possible

effect of snapping. Thereby, the loss of stability is assumed as probable in the interval  $p_{\min}^0 < p^0 < p_*^0$ . Thus, it is necessary to determine the equilibrium form of spherical shells in the region of large displacements. The authors review earlier attempts to solve the problem and conclude that variational methods could no longer yield useful results. Below, the numerical solution (obtained by means of computers) is given of the nonlinear equations of a half-sphere. The solution is independent of the parameter  $R/h$  (radius to thickness); it is exact within the limits of applicability of the equations for sloping shells. The equations for sloping shells are, assuming an axisymmetric form of equilibrium, (and after transformation and linearization):

$$x \frac{d^2 \psi}{dx^2} + \frac{d\psi}{dx} - \frac{\psi}{x} = \theta x \quad (2.8)$$

$$x \frac{d^2 \theta}{dx^2} + \frac{d\theta}{dx} - \frac{\theta}{x} = -\psi x - p_0 x \theta \quad (2.9)$$

where  $x$  represents the dimensionless radius,  $\theta$  - the angle of rotation of the meridian arc, and  $\psi$  is a measure of the difference between the radial stress  $T_1$  and its value  $1/2 pR$ , corresponding to

Card 2/5

D299/D304

On the axisymmetric equilibrium ...

the membrane state. The linearization applies to the interval  $x > x_k$

The solution in the linear interval, is obtained in terms of Hankel functions of a complex argument. These functions are not tabulated and a method for computing them is proposed which involves asymptotic expansion. Further, the non-linear interval  $0 \leq x \leq x_k$  is considered. Introducing the notations

$$\frac{d\theta}{dx} = u, \quad \frac{d\psi}{dx} = v, \quad (4.1)$$

the original system of equations is rewritten in finite differences:

$$\begin{aligned} \Delta v &= \left[ \theta + \frac{\theta^2}{2x} - \frac{v}{x} + \frac{\psi}{x^2} \right] \Delta x \\ \Delta u &= \left[ -\psi - \frac{\psi\theta}{x} - p_0\theta - \frac{u}{x} + \frac{\theta}{x^2} \right] \Delta x \\ \Delta\theta &= u\Delta x, \quad \Delta\psi = v\Delta x \end{aligned} \quad (4.2)$$

From the conditions of continuity one obtains

Card 3/5

On the axisymmetric equilibrium ...

21345  
S/040/61/025/006/012/021  
D299/D304

$$K_1 \theta_k + K_2 \psi_k - u_k = 0, \quad -K_2 \theta_k + K_3 \psi_k - v_k = 0 \quad (4.5)$$

where  $K_1, K_2, K_3$  are given by expressions. The order of the computations was as follows:  $p_0$  was assumed  $\leq 2$ ,  $x_k = 10$ ; thereupon  $K_1, K_2, K_3$  were calculated and equations (4.2) were numerically integrated; the values of  $u_k, v_k, \theta_k$  and  $\psi_k$  obtained by integration, were substituted in Eq. (4.5). The integration was carried out by means of a digital computer. The obtained results are summarized in a figure. The minimum buckling load was found to be  $p_0^{\min} = 0.06$ , where-  
by the relative buckling  $w/h = 22-23$ . There are 9 figures and 8 references: 4 Soviet-bloc and 4 non-Soviet-bloc. The references to the English-language publications read as follows: T. von Karman, and H.S. Chemical Abstracts  
May 25, 1954  
Dyes and Textile Chemistry

1 The synthesis of organic dyes. Igor Belic, Zora Gabrijelcic, Metod Poganec, Vladimir Premy, Ivan Zgonc, Mihaljo Zlat, Colko Zupan, and Vlado Zupan (Inst. Ind. Research, Ljubljana). *Kem. Zbornik* 1951, 128-30. —  
The synthesis of many dyes used in the textile and other industries is discussed. Brief descriptions of the synthesis are given for the following dyes: (1) sulfate black; benzene is chlorinated to produce monochlorobenzene which is then nitrated to produce 1-chloro-2,4-dinitrobenzene. This is converted to 2,4-dinitrophenol by heating with NaOH. The 2,4-dinitrophenol is heated with a soln. of polysulfide and the product, upon oxidation in air, gives the sulfate black dye. This method has been used on a semi-industrial scale to produce 10-ton amts. of the dye. (2) Sulfate blue; chlorobenzene is nitrated to give a mixt. of *o*- and *p*-nitrochlorobenzene. The latter is treated with NaOH soln. in an autoclave at 6-7 atm. pressure to give nitrophenol. This is reduced in the presence of Fe in a salt (NaCl) soln. to give *p*-aminophenol which is condensed with 1-chloro-2,4-dinitrobenzene to give 2,4-dinitro-4'-hydroxydiphenylamine. Heating this product with a soln. of Na<sub>2</sub>S<sub>2</sub> in various concns. and under different conditions followed by oxidation gives 2 blue dyes of different identity. (3) Sulfate brown; naphthalene is nitrated to give mononitronaphthalene which is further nitrated to produce a mixt. of 1,5- and 1,8-dinitronaphthalene which is then heated in a rotating Fe drum with Na<sub>2</sub>S and S to produce the dye. (4) Hydron Olive dye; anthracene is heated in a rotating drum with S. The product is extd. with Na<sub>2</sub>S<sub>2</sub> to produce the dye. (5) Chrome blue and chrome black for wool; a soln. of 2-naphthol is treated with a soln. of

2/2 Igor Belic, etc. (9)

$\text{NaNO}_2$  in  $\text{H}_2\text{SO}_4$  to produce 1-nitroso-2-naphthol, which upon the addn. of  $\text{NaHSO}_3$  and  $\text{H}_2\text{SO}_4$  gives 1-amino-2-naphthol-4-sulfonic acid. This is then subjected to the diazo reaction to form 1-diazo-2-naphthol-4-sulfonic acid. The Na salt of this acid is treated with a soln. of the Na salt of 2-naphthol. This produces a dark blue dye. (8) Nigrosine; this dye is prepd. by heating  $\text{PhNH}_2 \cdot \text{HCl}$  with  $\text{PhNO}_2$  and treating the reaction product with  $\text{NaOH}$ . The syntheses of azo dyes and of indanthrene dyes are also discussed.

Gig 1 San, No 4, pp 15-19

Describes series of tests conducted by sanitation and toxicology agencies, to determine the danger of high DDT content waste waters (released by enterprises producing this insecticide) which flow into reservoirs. Tests revealed that should the reservoirs have a maximum content of 2 mg/l of technical rate DDT, and no more than a 0.25 mg/l content of technical rate DDT dissolved in an org solvent, no adverse effects could be expected on the health conditions of the people using the waters of the reservoir for drinking or household purposes.

TITLE: Use of a silicon diffused p-n junction as a nuclear particle detector

SOURCE: Ref. zh. Fizika, Abs. 12A477

REF SOURCE: Tr. 6-y Nauchno-tekhn. konferentsii po yadern. radioelektron. T. 1. M., Atomizdat, 1964, 7-11

TOPIC TAGS: particle detector, pn junction, silicon semiconductor, physical diffusion, volt ampere characteristic, Alpha detector

ABSTRACT: A procedure is described for preparing a semiconductor detector for nuclear particles of single-crystal p-type silicon with specific resistivity 2000 ohm-cm. The p-n junction was made by diffusion of phosphorus from the gas phase for 40 minutes at a temperature +1150C into a depth of 2 - 3  $\mu$ . The operating area of the detector is ~30 mm<sup>2</sup>. The volt-ampere characteristics of the detector are presented. Alpha particles are registered with the detector starting with zero reverse bias. The amplitude of the pulses reaches saturation at a reverse bias of ~10 v. The energy resolution of the detector is 4 - 5%. Improvement in the technology makes commercial production of diffusion detectors possible. L. Leshchuk. [Translation of abstract]

PROCESSING AND PROPERTIES INDEX

**Piezodilatometric method and some of its applications.**  
**A. B. Gabrilovich. Kolloid Zhur. 11, 17-23(1949).—**  
 Since compressibility  $\beta$  of gases is much greater than that of liquids, the presence of even 0.01% of gas can be detected by a measurable increase in  $\beta$ . For the expts. a dilatometer was used, capacity  $\approx 2$  ml., with a capillary, cross-sectional area  $\approx 0.2$  sq. mm. When the capillary and the space around the dilatometer were connected to an air reservoir at 600 mm. Hg. the expansion (detd. to 0.002 cu. mm.) was sufficient to calc.  $\beta$ . The dilatometer was immersed in a Dewar flask filled with  $H_2O$ ; this flask was kept in a  $H_2O$  thermostat. If the temp. in the outer thermostat was const. within  $\pm 0.01^\circ$ , the temp. in the Dewar flask was const. within  $\pm 0.001^\circ$ . The PhMe thermometer used was read to  $\pm 0.001^\circ$ . Tarasov (Thesis 1939) observed contraction on immersing frog muscles, etc., in physiol. salt soln. and its variation in the presence of toxins. Detn. of  $\beta$  proves that this contraction is due to gradual dissolv. of gas originally present in the animal tissue and is not a measure of the binding of  $H_2O$  by the tissues. Fresh tissue may contain as much as 4 cu. mm. of gas per 0.4 g. J. J. B.

TITLE: Dependence of the nucleotide composition of bacterial DNA on the lysogenic state of bacteria

SOURCE: AN BSSR. Doklady, v. 9, no. 8, 1965, 550-551

TOPIC TAGS: DNA, bacteria, virus, bacteriophage, bacterial genetics

ABSTRACT: The study was undertaken in order to determine the dependence of the strain differences in the DNA composition of Klebsiella scleromatis on the lysogenic state and the type of bacterial virus. To this end, lysogenic cultures were obtained by lysogenesis by phages of various types of the phagesensitive strain Klebsiella scleromatis 380, whose lysogenesis could not be established previously. In the six artificially lysogenic strains thus obtained, the DNA composition was determined and compared with the composition of the original culture No. 380. It was found that (1) DNA of 380/483 strain differs substantially from the DNA of the original culture in total content of adenine and thymine, and (2) DNA of the 380/C strain is characterized by a considerable thymine deficit. The paper was presented by Academician V. A. Leonov of the AN BSSR. Orig. art. has: 1 table.

TITLE: Protective effect of S-beta-aminoethylisothiuron bromide on the T2 phage

SOURCE: Radiobiologiya, v. 5, no. 2, 1965, 314-315

TOPIC TAGS: phage, aminoethylisothiuron, radioprotector, gamma radiation, radiation dose

ABSTRACT: T2 phages ( $10^5$ - $10^6$  particles) were gamma-irradiated (Co-60 unit) with different doses ( $10^4$ - $5 \times 10^5$  r) in Hutterer's broth (pH 7.5, with 210-220 mg% of amine nitrogen) containing a 0.2% aqueous solution of S-beta-aminoethylisothiuron bromide (AET). The radioprotective effect of AET determined by phage survival was found to grow with increased radiation doses and at the same time the absolute percentage for phage survival sharply dropped. For a  $5 \times 10^4$  -  $10^5$  r dose when the absolute survival rate is still considerable, the relative protective effect does not exceed 2 which according to literature data roughly coincides with the amount of excitation energy diverted from the DNA type structures to the AET. The author concludes that within the investigated gamma radiation dose range, AET displays a marked radioprotective effect on T2 phages.

New home in Belorussian SSR are larger and have more space per capita,  
but shortcomings are not enough window space and insufficient natural  
light, etc. This is due to the failure of public health organizations to  
participate in the design and construction. Suggests that this be corrected.

1063. HYGIENIC FEATURES OF THE NEW BUILDINGS AND DEVELOPMENT  
OF THE 'RASSVET' COLLECTIVE FARM (Russian text) - Gabrilovich  
M. A. - ZDRAVOOKHR. BELOR. 1956, 11 (53: 5)

A description is given of the planning, building and development of the Myshkovichi estate, the centre of a 'Rassvet' collective farm, having a multifarious and highly mechanized economy and large number of industrial and cultural buildings and dwelling houses. The compact planning of the village is noteworthy. The broad streets of the estate run north and south. Housing plots are large; the front gardens extend for 5 to 10 m. The collective farms are provided with fruit orchards, lavatories and baths. The majority of the houses are built to a standard plan and have 2-3 rooms, of sufficient area and spaciousness. The water supply is provided by concrete wells - one well for 10 houses - equipped with covers and buckets. The swamps around the village have been drained and trees have been planted on the sands. There is insufficient separation of the dwelling houses from the cattle-rearing farms. The next tasks facing the community are the building of public baths, nurseries and water mains and surfacing of the roads and planting of trees along them.
